

How your signals reach the app

This explains exactly how the trade signals you post in Telegram appear inside the Blakey Trades app — automatically, in seconds, for your verified members. **Nothing changes about how you work.** You keep posting in Telegram exactly as you do now; the app reads your calls and delivers them. You never post in two places.

The one thing we need from you: add our app's bot as an administrator on each of your signal channels. It takes about 30 seconds per channel. That's the only action required on your side — everything after that is automatic. Full steps are in Section 2.

1 How it works

From the moment you hit send in Telegram to a notification on your member's phone — in seconds.

1 You post a signal in Telegram

Exactly as you do today — entry, stop, targets — in your VIP, Swing, Zones or Scalps channels. No new tools, no new steps.

2 Our bot reads the post instantly

A private bot — created and managed entirely by us — sits quietly in your channels as an admin. The instant you post, it receives the message. Your members never see it; it doesn't post anything.

3 The signal is read and structured

The system reads your call and pulls out the details — pair, direction, entry, stop and every target — and files them as a clean, tappable trade in the app.

4 It's delivered to verified members

The trade appears live in the app's signal feed and a push notification lands on every verified member's phone — typically within a few seconds of you posting.

5 Your follow-ups keep it updated

When you post an update — "partials here", "stop to breakeven", "closed +40 pips" — the app updates the same trade in place, so members always see its current state, not a cluttered stream.

2 What we need from you

Add our bot as an administrator on each signal channel. We'll send you the bot's exact username; then, in Telegram:

- 1 Open the channel in Telegram and tap the **channel name** at the top.
- 2 Tap **Administrators** (under "Manage Channel" on some versions).
- 3 Tap **Add Administrator** and search the bot username we give you.
- 4 Select it and tap **Save/Done**. It only needs to read posts — you can leave every other permission off.
- 5 Repeat for each **signal channel** you want feeding the app.

Is this safe? Being an admin is simply what Telegram requires for a bot to receive a channel's posts — it does **not** give anyone control of your channel, and your subscribers won't see any change. You can remove the bot at any time.

3 What happens to each signal

ENTRY SIGNALS

Read cleanly, every time

Your entry, stop and all targets are pulled out and shown as a proper trade card — with a live chart, the levels, and its status (running / hit target / stopped).

FOLLOW-UP UPDATES

Attached to the right trade

"Partials", "SL to breakeven", "closed" — these attach to the original call and update its status, rather than appearing as loose, confusing messages.

EDITS

Kept in sync

If you edit a message in Telegram, the app updates that same trade — so what members see always matches what you posted.

EDUCATION & CHAT

Stays where it belongs

Only your trade calls are turned into signals. General chat and education aren't mistaken for trades — the system knows the difference.

Example. You post in Telegram:

🔴 SELL XAUUSD — Entry 4,051, SL 4,059, TP1 4,043 · TP2 4,035

Seconds later every verified member gets a push — "🔴 BT VIP · New gold call" — and taps into a full trade card with the chart and levels already laid out.

4 Who receives the signals

Your calls only go to the members who should have them.

Every signal is delivered **only to verified members** — the traders confirmed under your broker partnership. Anyone not verified sees that a live call is running but the entry, stop and targets stay

locked, with a prompt to get verified. So the app doesn't just deliver your signals faster than Telegram — it makes sure they reach the right people, and turns the lock screen into a route for new members to join properly.

5 Your workflow — unchanged

- ✓ You **post once**, in Telegram, exactly as you do now.
 - ✓ No new app, dashboard or tool to learn — you change nothing.
 - ✓ The app becomes the premium, members-only home for your calls — with push alerts, a verified track record, and everything gated to your members.
 - ✓ You can add or remove the bot from any channel whenever you like — you stay in full control.
-

6 Summary — the ask

Everything we need to switch this on:

- ✓ **Admin access** for our bot on each signal channel (we send you the username; ~30 seconds per channel — Section 2).
 - ✓ **Confirm which channels** should feed the app.
-

That's it. Once the bot is an admin on your channels, your signals start flowing into the app automatically. Any questions, we're happy to walk through it live.
